Australia's first biodegradable reusable bag launches

[Thu 18/08/2011 02:54:07]

Earth Bags Australia has launched a new stylish, ethical bag that's destined to change the face of reusable products in Australia and is perfect for green-minded conference and event organisers.

Launched by a Western Australia based company, Earth Bags are perfect for conferencing and events.

Sustainable and free from chemical toxins, Earth Bags are different to the standard 'green' polypropylene bags. While they are strong, robust and practical like their older counter-part, they have a very important difference – they are one hundred per cent biodegradable.

"There are millions of reusable bags currently in use in Australia. I don't think people are aware that the majority of these bags contain lead and petroleum products and are as harmful to the environment as plastic bags," said Earth Bags Australia director Reg Ferguson.

"After years of extensive research and planning, we're thrilled to be bringing the Earth Bag to market. To mark the occasion, we have sent out a hundred limited edition Earth Bags to a select number of people here in Australia so hopefully people will start to see the Bags out and about soon."

Developed in Western Australia, Earth Bags can be used for up to two years and are scientifically proven to become compost 45 days after disposal without any negative impact to the environment¹.

"We at Earth Bags Australia felt that a more environmentally friendly bag that consumers and businesses can use was required. We are confident that we've developed a market first, which has been supported by research from Murdoch University in WA," he added.

Earth Bags produce approximately 20 per cent less carbon emissions during manufacture and disposal than polypropylene bags². Commenting on the environmental claims made about the Earth Bag, Dr Martin Anda from Murdoch University's School of Environmental Science said,

"We investigated whether the much used green bags, are less environmentally friendly than Earth Bags. Our research demonstrated that Earth Bags biodegrade completely in a composting environment after 45 days, whereas there was no noted difference in the appearance of the green bag after enduring the same environmental controls," Dr Anda said.

"Our research also showed that Earth Bags contribute to the organic content of the soil once it has biodegraded. This again reinforces the environmental benefits of the Earth Bag versus green bags," Anda said.

Earth Bags are made entirely from paper sourced from sustainable forests and spun using a complex weaving process, recycled water and a natural beeswax coating that solidifies the paper into the long-lasting Earth Bag.

"Perfecting the production process was an arduous task but one that was important to Earth Bags Australia in illustrating our commitment to sustainable environmental solutions," said Ferguson.

Versatile and practical – Earth Bags are available in a variety of styles and designs which can be tailor-made for the general public and business community.
